

Ingersoll Rand

NL Module

Less Energy Use, Longer Life

Ingersoll Rand's NL Module coalescing filters provide true oil-free compressed air with minimal pressure drop of 0.5 psid for long-term cost savings. Superior air quality is achieved by effectively removing damaging oil and water aerosols before they flow through air system piping, process equipment and pneumatic valves and tools.

Conventional filters used to achieve similar air quality typically operate at a pressure drop 6 psid higher than the NL Module, and have a far shorter service life.

These maintenance-free filters feature a high-quality design that extends element life to 10 to 15 years and helps eliminate system downtime by reducing the effects of a catastrophic failure of the compressor's air/oil separator.

Once the pressure differential reaches 3 psid or greater, it is time to change the element. This requires depressurization of the vessel as well as lid and element removal.

Benefits

- High-efficiency particulate filtration to 0.5 ppm
 - > 3 microns at 100%
 - 0.1 to 3 microns at 99.98%
- Effective oil removal
 - 2 ppm in = 0.01 ppm out
 - 10 ppm in = 0.05 ppm out
- Low pressure drop resulting in low energy costs
- Extended element life — 10 -15 years
- Effective on all common mineral and synthetic lubricants
- Standard differential pressure gauge indicates element condition
- Virtually maintenance-free

NL Modules

How Coalescing Filters Work

Air contaminated with mineral or synthetic oil and water aerosols enters the NL Module housing (1) and flows horizontally through a deep filter bed (2). Sub-micron particles collect on individual bed fibers and coalesce to form droplets (3). As the droplets move through the filter bed, they become larger and their resulting weight forces them to drop to the bottom of the housing (4). Low internal velocity prevents oil re-entrainment, while the large surface area keeps the pressure drop very low over the life of the element. The long residence time through the deep filter bed ensures the highest coalescing efficiency. Automatic or manual drains can be used to discharge lubricant and water that accumulate in the bottom of the housing (5). Compressed air and drain hookups are all that's required to integrate an NL Module into your compressed air system — no electricity is used.

Depth of Bed Filtration 
Deep-bed filtration provides more surface area for the highest coalescing efficiency
